

Automation / AI Agent Workflow Overview

1. Workflow Diagram

2. Below is the explanation :

This workflow automates the process of reviewing and qualifying new leads using AI.

The process starts when a **new lead is added to Google Sheets**. The workflow first checks that the lead is marked as *New* and has not already been processed. It then performs a **duplicate check using the lead's email address** to ensure the same lead is not processed multiple times.

Once validated, the lead data is sent to an **AI scoring agent (OpenAI)**. The AI analyzes the requirement text and determines the lead's **intent, score, and summary** based on a rubric-based evaluation. These AI results are then written back to the **same Google Sheet row** for tracking and visibility.

Next, the workflow uses **intent-based routing** to assign the lead to the appropriate path:

- **Priority Review (Hot leads)**
- **Sales Follow-Up (Warm leads)**
- **Nurture Pipeline (Cold leads)**

Based on the assigned intent, a **personalized email is sent to the lead**. After the email is sent, the workflow updates the same Google Sheet row to record:

- Email sent status
- Email sent timestamp
- Email type (Hot / Warm / Cold)

This ensures that every lead is processed only once, all actions are traceable, and the system remains transparent and easy to audit.
