

Executive Summary

AI-Powered Lead Generation & Qualification Workflow

1. Project Overview

This project is an **AI-based lead generation and qualification system**.

The goal of this project is to automatically review incoming leads, understand their intent, give them a score, assign the right owner, and send follow-up emails without manual effort.

The workflow is built using **Make.com, OpenAI, Google Sheets, and Gmail**.

It is designed to be **simple to understand, easy to track, and practical for real business use**.

2. Problem Statement

In many companies, incoming leads are reviewed manually. This causes several problems:

- High-intent leads may not be contacted quickly
- Sales teams waste time reviewing low-quality leads
- Lead scoring depends on personal judgment and can be inconsistent
- There is no clear explanation of why a lead was marked as high or low priority

This project solves these problems by using **AI to score and route leads in a consistent and explainable way**.

3. Solution Overview

The workflow automates the full lead qualification process from start to end.

Lead Intake

- Leads are stored in a **Google Sheet**, which works like a simple CRM.
- Each lead includes name, email, requirement, and source (website, social media, referral).

Trigger Control

- The workflow only processes **new leads**.
- Leads that are already processed are skipped.
- This prevents duplicate processing and re-runs.

AI Evaluation

- The lead requirement text is sent to OpenAI.
- The AI analyzes:
 - urgency
 - clarity of requirement
 - business intent
 - level of interest
- The AI returns a **JSON response** with:
 - lead score (0–100)
 - intent (Hot, Warm, Cold)
 - short explanation
 - assigned owner

4. Scoring and Routing Logic

The scoring logic is **rule-based but flexible**.

- Urgent demo or pricing requests get higher scores
- Clear business needs increase the score
- Vague, empty, or meaningless requirements reduce the score
- Personal emails with unclear intent are scored lower

Based on the score:

- **Hot leads** → Priority Review
- **Warm leads** → Sales Follow-Up
- **Cold leads** → Nurture Pipeline

This makes sure sales teams focus on the right leads at the right time.

5. Automated Actions

After scoring and routing:

- Internal notification emails are sent for high-intent leads
- Confirmation emails are sent to leads when required
- All results are saved back into Google Sheets

Each lead record shows:

- AI score
- AI intent
- AI summary
- Assigned owner
- Processing timestamps (UTC and PST)
- Email sent status

This makes the system easy to track and audit.

6. Testing and Scenarios Covered

The workflow was tested using multiple scenarios, including:

- High-intent leads requesting demos or pricing
- Medium-intent leads exploring options
- Low-intent leads just browsing
- Empty requirement inputs
- Gibberish or invalid input
- Personal email with vague intent
- Duplicate lead entries

These scenarios ensure the workflow works correctly for both **normal cases and edge cases**.

7. Results and Benefits

This project helps businesses by:

- Reducing manual lead review
- Improving response time for high-value leads
- Avoiding sales team overload
- Making lead decisions clear and explainable

The workflow is simple, scalable, and suitable for real-world use.

8. Conclusion

This AI-powered lead qualification workflow shows how AI can be used in a **practical and responsible way**.

The project focuses on clarity, control, and quality rather than automation alone.

It demonstrates a strong understanding of **workflow design, AI evaluation, and test coverage**, making it suitable for real business environments.
